

## Tecnis Symphony and Symphony with Toric

The latest addition to the Tecnis Family of presbyopia-correcting IOLs offers new optical technology for providing an Extended Range of Vision.

Traditional Multifocal IOL for treating presbyopia work on the principle of simultaneous vision by splitting light into distance and near focal points.

**Tecnis Symphony IOL is the first and only presbyopia-correcting extended range of vision IOL.**

The TECNIS Symphony Extended Range of Vision or Extended Depth of Focus (EDOF) IOL delivers a continuous range of vision without the splitting of light into distance and near focal points. Its range of vision extends from superb distance vision to excellent intermediate vision, and in many cases functional reading vision at about 20-21 inches (52 cm) and perhaps even closer. It has a low incidence of glare and very low incidence of haloes, less than traditional multifocal IOLs, almost comparable to basic monofocal IOLs.

An additional advantage of the Symphony IOL is that it is also available in toric versions to correct low to even high amounts of astigmatism.
